y = boston['MEDV'].values
```

# Predicting house value from a single feature

```
X_rooms = X[:,5]
type(X_rooms), type(y)
```

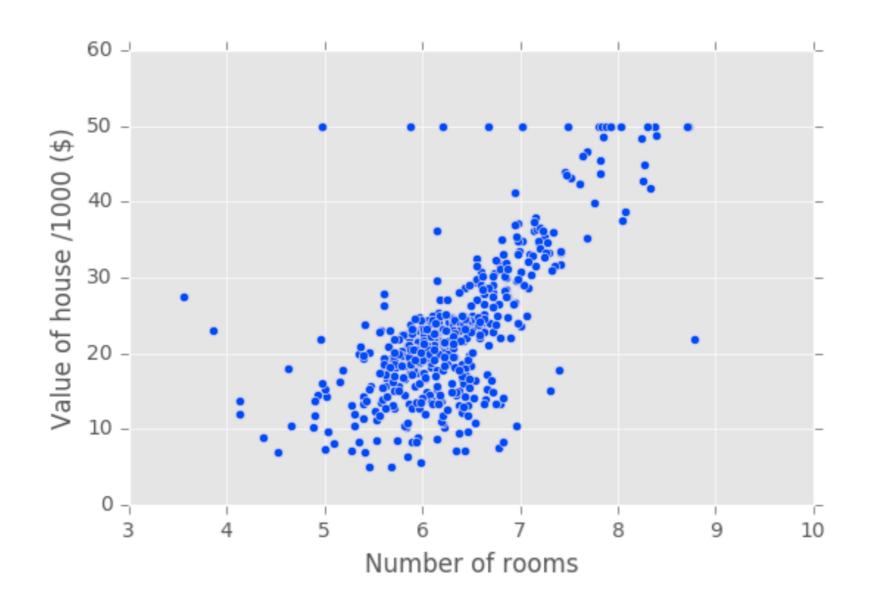

#### (numpy.ndarray, numpy.ndarray)

```
y = y.reshape(-1, 1)
X_rooms = X_rooms.reshape(-1, 1)
```

## Plotting house value vs. number of rooms

```
plt.scatter(X_rooms, y)
plt.ylabel('Value of house /1000 ($)')
plt.xlabel('Number of rooms')
plt.show();
```

### Plotting house value vs. number of rooms

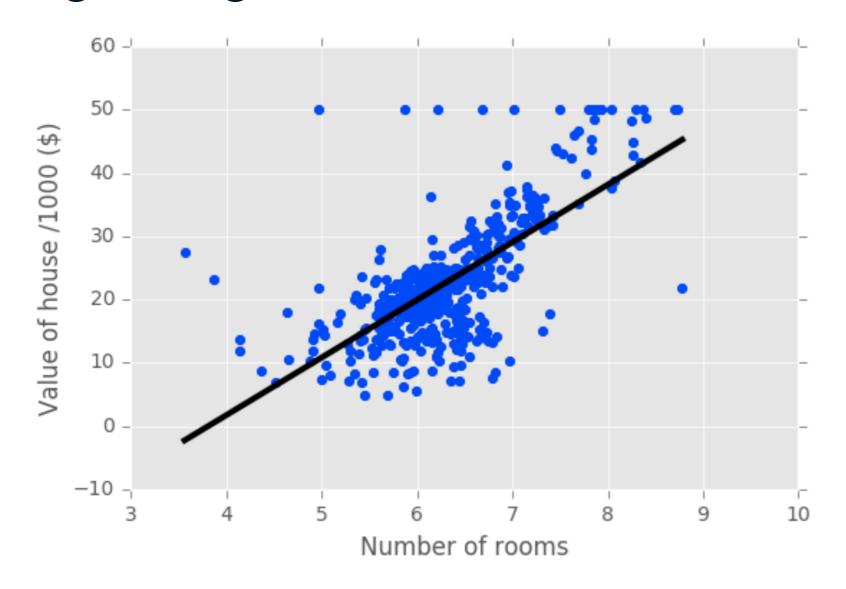

# Fitting a regression model

# Fitting a regression model

# Let's practice!

SUPERVISED LEARNING WITH SCIKIT-LEARN

# The basics of linear regression

SUPERVISED LEARNING WITH SCIKIT-LEARN

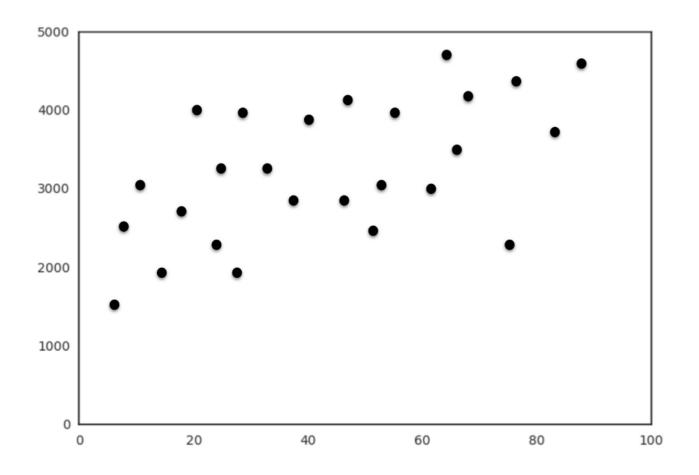

**Hugo Bowne-Anderson**Data Scientist, DataCamp

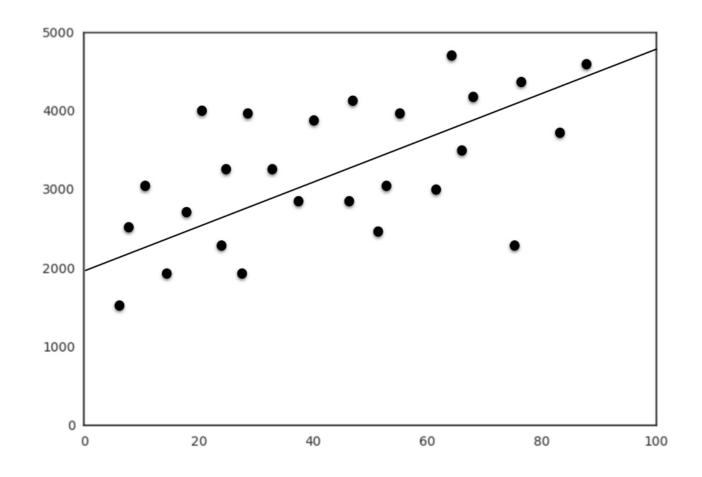

# Regression mechanics

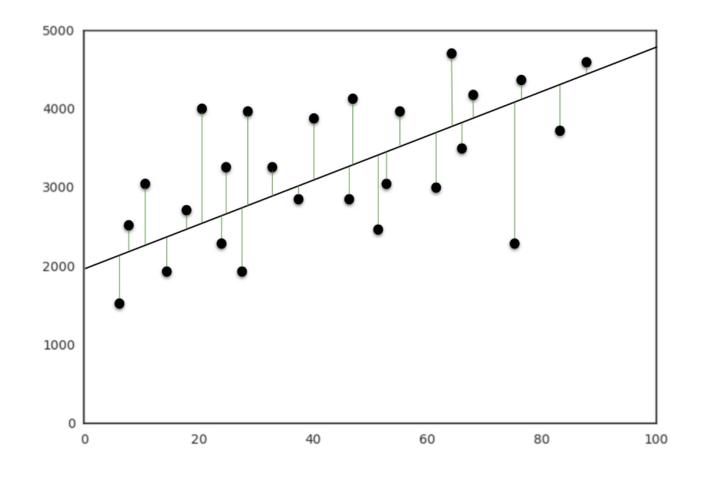

- y = ax + b
  - $\circ$  y = target
  - x = single feature
  - o a, b = parameters of model
- How do we choose a and b?
- Define an error functions for any given line
  - Choose the line that minimizes the error function

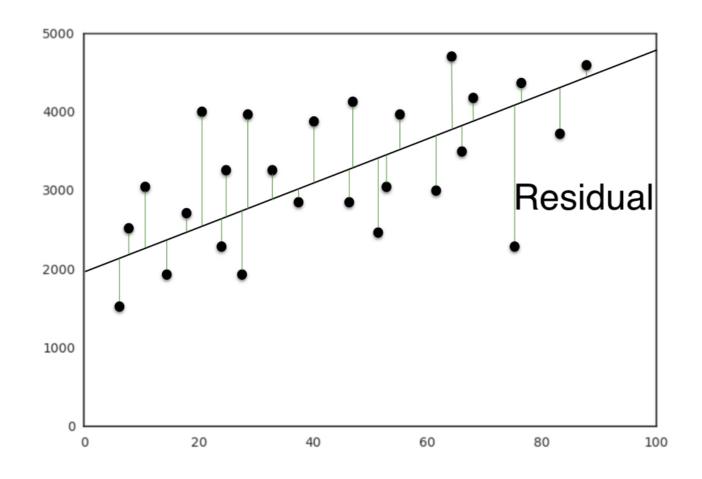

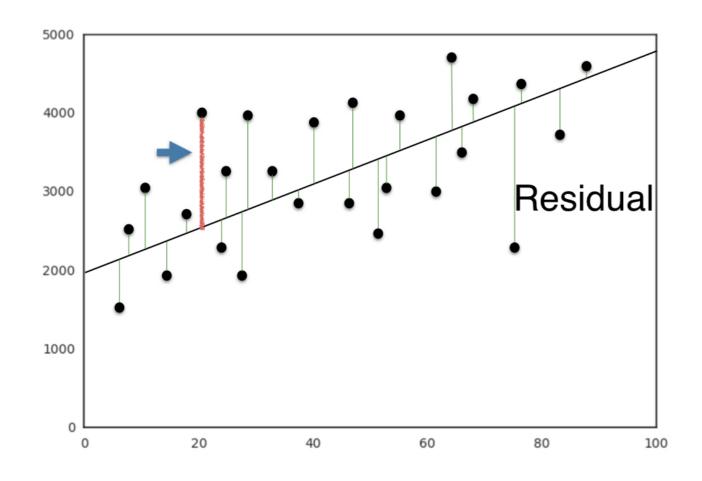

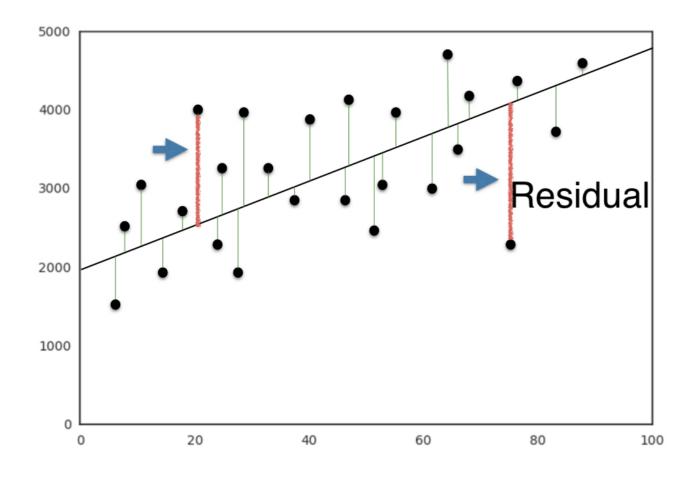

Ordinary least squares(OLS): Minimize sum of squares of residuals

# Linear regression in higher dimensions

$$y = a_1 x_1 + a_2 x_2 + b$$

- To fit a linear regression model here:
  - Need to specify 3 variables
- In higher dimensions:
  - Must specify coefficient for each feature and the variable
     b

$$y = a_1x_1 + a_2x_2 + a_3x_3 + ... + a_nx_n + b$$

- Scikit-learn API works exactly the same way:
  - o Pass two arrays: Features, and target

## Linear regression on all features

```
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LinearRegression

X_train, X_test, y_train, y_test = train_test_split(X, y,
    test_size = 0.3, random_state=42)

reg_all = LinearRegression()

reg_all.fit(X_train, y_train)
y_pred = reg_all.predict(X_test)

reg_all.score(X_test, y_test)
```

0.71122600574849526

# Let's practice!

SUPERVISED LEARNING WITH SCIKIT-LEARN

# **Cross-validation**

SUPERVISED LEARNING WITH SCIKIT-LEARN

**Hugo Bowne-Anderson**Data Scientist, DataCamp

#### **Cross-validation motivation**

- Model performance is dependent on way the data is split
- Not representative of the model's ability to generalize
- Solution: Cross-validation!

# Let's practice!

SUPERVISED LEARNING WITH SCIKIT-LEARN

# Regularized regression

SUPERVISED LEARNING WITH SCIKIT-LEARN

**Hugo Bowne-Anderson**Data Scientist, DataCamp

## Why regularize?

- Recall: Linear regression minimizes a loss function
- It chooses a coefficient for each feature variable
- Large coefficients can lead to overfitting
- Penalizing large coefficients: Regularization

## Ridge regression

Loss function = OLS loss function +

$$lpha * \sum_{i=1}^n {a_i}^2$$

- Alpha: Parameter we need to choose
- Picking alpha here is similar to picking k in k-NN
- Hyperparameter tuning (More in Chapter 3)
- Alpha controls model complexity
  - Alpha = 0: We get back OLS (Can lead to overfitting)
  - Very high alpha: Can lead to underfitting

#### Ridge regression in scikit-learn

0.69969382751273179

## Lasso regression

• Loss function = OLS loss function +

$$lpha * \sum_{i=1}^{n} |a_i|$$

#### Lasso regression in scikit-learn

0.59502295353285506

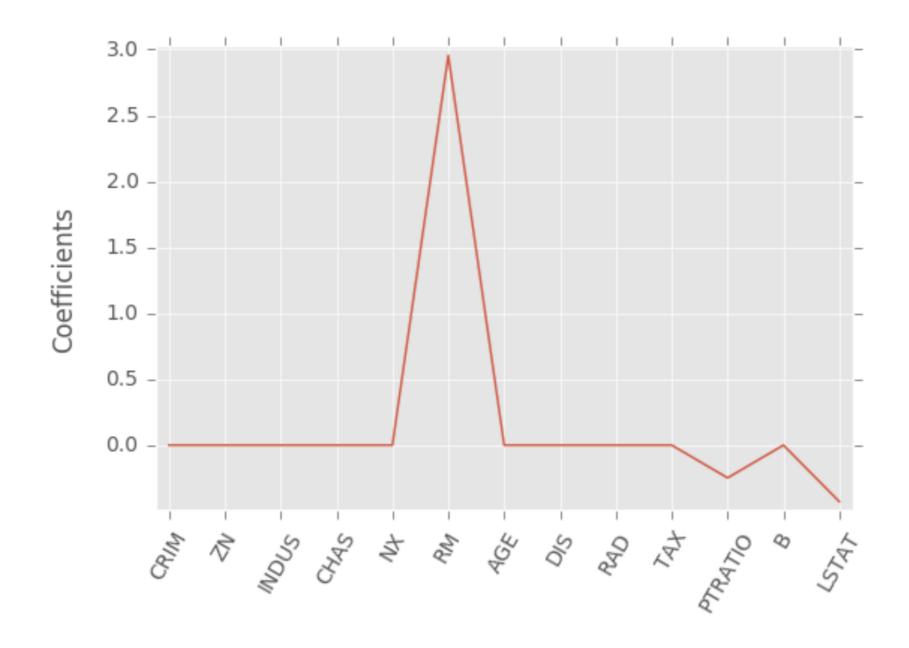

#### Lasso regression for feature selection

- Can be used to select important features of a dataset
- Shrinks the coefficients of less important features to exactly 0

#### Lasso for feature selection in scikit-learn

#### Lasso for feature selection in scikit-learn
